

Product sheet | **365 Advanced Classification**  
Extension for Microsoft Dynamics 365 Business Central

## Simplify your process

The advanced classification extension allows the user to classify the data of different entities (customers, suppliers and / or products) thus facilitating not having to use dimensions, a much more complicated process to use.

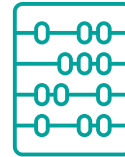

At last you will have analytical vectors in management without the need for them to explode in accounting

With our 365 Advanced Classification functionality you can simplify the process by configuring the entities you need

### Advanced set up

Easy and simple to configure. You can choose between a basic plan (4 entities) and an advanced one (8 entities)

### Create the entities you need

By default, customer, product and supplier are created but you can create the fields you need (up to 8)

### Advanced sorting in purchases

Assign advanced classification fields in the supplier card in your purchases

### Advanced sorting in sales

Assign advanced classification fields in the customer file in your sales
