

Product sheet | **365 Payroll Importing**

Extension for Microsoft Dynamics **365 Business Central**

Improve your employee payroll control safely

Import the accounting information of your employees' payroll by generating the entries in 365 Business Central with total security.

Payroll is a very sensitive subject, so you can also import an employee code relationship file for maximum privacy.

It will also allow you to generate a history of movements to be able to analyze them by amounts paid, group them by dates or by departments.

In addition, when necessary, the person in charge of this area can have a powerful and simple screen where they can view and analyze all the detailed information regarding an employee's history.

It is a very safe process because, when importing the payroll file in 365 Business Central, only the employee data that is necessary for the information (dimensions, department ...) will be accessed. Therefore, confidential employee information will never be stored in the payroll file.

With the **365 Payroll Importing** extension you will be able to map payroll concepts from an Excel file against ERP accounting accounts and configure accounting accounts, without intermediate steps between the agency and whoever enters the accounting.

Field mapping

Import your employees' payroll information through an Excel file and easily generate accounting entries in 365 Business Central.

Secure process

Confidential employee information is never stored in the payroll file.

History of movements

Analyze the amounts paid and group them by dates, departments, etc. thanks to a historical table of payroll movements.
